

What is claimed is:

1. A socket protective cover for preventing single-opening insertion comprising:

a housing having insertion openings;

5 a sliding base assembled in the housing, being capable of transverse sliding movements, and having restoring elasticity;

covers provided for corresponding with positions of the insertion openings, being capable of pivotal rotations on the sliding base, and having restoring elasticity and blocking members for extending into

10 the insertion openings of the housing; and

the characteristics being that, when the blocking members at the covers are simultaneously pushed and departed from the insertion openings, the covers are pivotally rotated and tilted on the sliding base, and a subsequent force imposed upon the covers pushes the

15 covers and the sliding base sideward; however, when the blocking members at the covers are not simultaneously pushed and departed from the insertion openings, the other blocking member not pushed away from the insertion opening remains in the insertion opening and blocks displacement of the sliding base.
